

Mews Corporate Long-Stay Network

Director of Product & Engineering, Long Stays — Take-Home Project Pitch

Tim Drisdelle · June 2026

The opportunity

Keystone problem / opportunity statement

In the next 12 months, Mews should instantiate itself as the corporate housing brokerage for the 28+ night segment, by building a Resident Platform substrate that closes long-stay PMS gaps for every existing customer running 28+ night stays (Tier 1, universal), and adds new product surfaces — corporate booker portal, property network view, mediated three-way contract view, dedicated long-stay booking engine, and resident web portal — that together compose Mews Corporate Long-Stay Network 1.0 (Tier 2, opt-in). The platform investment serves existing customers regardless of Network participation; the Network adds incremental B2B corporate housing demand for the properties that opt in.

Why now

- Sonder's collapse (November 2025) closed the master-lease model and made the structural broker gap visible.
- Branded extended-stay chains (Marriott StudioRes, Hilton LivSmart, Hyatt Studios, Wyndham ECHO, Choice Everhome) are racing to add owned supply but force buyers to negotiate property-by-property — no programmatic broker.
- Furnished Finder hit 46M+ nights booked at 28+ days in 2025 — demand is validated; the supply side has no quality floor or B2B contracting.
- Mews's own customers (Boost Society, Revisn, The Social Hub) are building around the PMS today to handle long stays — sophisticated customer-led evidence that the model abstraction is missing.
- Mews has \$375M+ in fresh capital (Series D \$300M + Tiger Global \$75M), Dallas hub opened October 2025, and AAHOA partnership signed for US expansion.

The addressable market

Disciplined funnel from a **\$183B global Long Stays market** to a **\$3B Year 3 reachable Network 1.0 target** via four scoping decisions: geographic focus (US-first), demand addressability (B2B corporate housing

buyer), supply addressability (extended-stay hotels and aparthotels operating on hotel PMSs), and Year 3 ramp.

Scoping decision	Result	Justification
Global Long Stays Market	\$183B	Baseline — all 28+ night lodging globally
Geographic focus: US-first	\$74B	Largest single market, where chains are land-grabbing, Mews growth focus
Demand addressability: B2B corporate housing buyer	\$54B	Five drivers fit broker model: business travel, relocation, project workforce, healthcare, insurance
Supply addressability: hotel PMS operators	\$30B	Extended-stay hotels + aparthotels on hotel PMSs. Residential MTR (\$24B) on different software stacks
Year 3 ramp: Network 1.0 target	\$3B	Upper bound of reachable GMV with aggressive opt-in + Network channel capture

What's not in the \$3B

Year 4+ continued US supply ramp; international expansion (EU, APAC, LATAM); B2C consumer demand via the long-stay booking engine; existing Mews PMS subscription and Payments revenue from these properties. The \$3B is purely the Network's incremental contribution at Year 3.

The four orthogonal axes

The take-home navigates four conceptual axes that are easy to confuse but each play a specific role. Mixing them up is what makes long-stay conversations muddled.

1. Operator universe (supply side)

In scope: extended-stay hotels, aparthotels (operate on hotel PMSs like Mews). **Out of scope:** mid-term rental operators on residential software stacks (AppFolio, Buildium, Hostfully), PBSA on specialized software (StarRez).

2. Duration (stay length)

In scope: 28+ nights. Below 28 handled by core Mews PMS. Upper bound governed by local jurisdiction — Bail mobilité in France (10 months), Boardinghouse in Germany (90 days), corporate-let frameworks in UK and US (essentially unbounded for B2B), state-by-state US tenancy variation.

3. Terminology (linguistic clarity)

- "Long stay" — duration term, 28+ nights
- "Extended-stay hotels and aparthotels" — supply universe we serve
- "Mid-term rental operators" — the residential side outside our supply scope
- "Corporate housing buyer" — primary demand side, five drivers
- "Mews Corporate Long-Stay Network" — the marketplace product itself

4. Brokerage addressability (demand side)

- **Broker-addressable (5 drivers):** business travel, relocation, project workforce, healthcare placements, insurance ALE
- **Non-addressable (4 drivers):** students, digital nomads, leisure long-stays, other — served by other channels (institutional housing, OTAs, direct property bookings)

The critical insight

These axes are orthogonal. A single Mews property (The Social Hub in Amsterdam, for example) can simultaneously host broker-addressable demand (corporate consultants) AND non-addressable demand (semester students). The Network captures the broker-addressable slice; everything else continues to flow through existing direct, OTA, and institutional channels — but on a vastly better PMS substrate.

Two-tier customer benefit model

The Resident Platform investment produces value at two distinct layers. Customers access either or both.

Tier 1 — Property-side benefits (universal)

Available to all long-stay-running Mews customers regardless of Network participation. Built on top of Mews's recent long-stay infrastructure investments (Mews Recurring Payments 2024, City Ledger February 2025, DocuSign integration December 2025, Ledgers and Granular Billing Automation December 2025).

- Resident as a first-class product object — replaces the current customer+reservation patchwork
- Lease as a first-class commercial primitive — real lease contracts with terms, deposits, renewals
- Cross-property resident identity — a travel nurse on three back-to-back contracts at three different Mews properties is the same Resident
- Resident lifecycle workflows — application, screening, signing, extension, transfer, renewal, move-out
- Resident-side operational tools — weekly housekeeping cadence, monthly statements, resident services, deposit lifecycle
- Closes the gaps current customers (Boost Society, Revisn) have built around: room reassignment on extension, split bill rates, AR reconciliation post-issue, jurisdiction-aware contracts

Tier 2 — Network benefits (opt-in)

For properties that want incremental corporate housing demand.

- Everything in Tier 1, plus:
- Inclusion in Mews Corporate Long-Stay Network as bookable inventory
- Corporate booker portal as a new demand channel from B2B buyers
- Network Membership Agreement framework for buyers
- Network Participation Agreement controls for properties (rate floor, max exposure %, blackout dates)
- Mediated contracting, Mews-managed payments routing, Mews-handled take rate

Pattern reference

Same architectural pattern as Stripe (Payments universal; Tax, Atlas, Connect opt-in), Shopify (Admin universal; verticals opt-in), or Salesforce (Sales/Service Cloud universal; industry clouds opt-in). The Resident Platform is the universal foundation; the Network is one of several monetization layers on top.

Mews Corporate Long-Stay Network 1.0 — Five product surfaces

Each surface serves a distinct actor in the brokerage lifecycle. The prototype implements four of the five web surfaces (resident mobile app on roadmap).

1. Long-stay booking engine (Tier 1, universal)

Property-side direct B2C/B2B booking surface for long-stay properties. Different abstraction than the standard Mews Booking Engine: property-set minimum stays (7-night, 28-night, 30-night minimums), quantization (book in increments of nights, weeks, or months), open-ended start dates, renewal-aware UX, resident-as-applicant flow, jurisdiction-aware terms. Replaces the standard Mews Booking Engine for long-stay properties.

2. Corporate booker portal (Tier 2, Network)

B2B demand surface. Corporate housing coordinator at a staffing agency or F500 mobility team searches opted-in Network inventory, contracts under their NMA, books placements for individual residents. This is the hero artifact of the demo.

3. Operator network view (Tier 2, Network)

Property-side surface. Operator sees incoming Network bookings, manages NPA settings (rate floor, max network exposure %, blackout dates), confirms or declines bookings, sees revenue dashboards and take-rate transparency. Runs alongside the existing Mews PMS.

4. Mediated three-way contract view (Tier 2, Network)

Mews-internal surface. The mediator's perspective on the three-contract structure (NMA + NPA + individual booking). Audit trail, payment routing visualization, contract document viewer, lifecycle state.

5. Resident web portal (Tier 1 + Tier 2)

How residents experience their stay. Lease document, room details, extension requests, resident services, move-out checklist. Mobile-first. Hints at the future resident mobile app (on roadmap, not in 1.0).

Roadmap (post-1.0)

Resident mobile app · Bail mobilité contract templates and lifecycle for France · EU launch · APAC and LATAM expansion (with regional broker-addressability re-filtering) · AI-native demand matching · Cross-property loyalty for repeat residents

Architectural approach — façade over Mews APIs

The Resident Platform is a façade on top of the Mews Connector API. It introduces Resident, Lease, and Buyer as first-class objects in its own data model, and orchestrates the existing Mews primitives (Reservations, Customers, Companies, CompanyContracts, BillingAutomations, PaymentPlans) underneath. The core Mews PMS is not refactored; it is composed.

Why this architecture

- Makes 12-month delivery credible — no core PMS refactor required
- De-risks the model — if the resident abstraction is wrong, the layer can be removed without touching core Mews
- Productization-ready — Resident Platform can be sold as a discrete SKU
- Enables the brokerage naturally — once Resident and Buyer are first-class, Network Membership Agreement and Network Participation Agreement plug in alongside
- Forces API discipline — gaps in the Mews Connector API surface get prioritized as the façade builds
- Industry-standard pattern — Stripe Tax, Shopify industry verticals, Salesforce industry clouds all follow this model

Mapping to existing Mews primitives

Resident Platform concept	Underlying Mews composition	Mews API ownership
Resident	Customer(s) — possibly across enterprises	Mews owns Customer profile; Resident Platform owns cross-enterprise identity
Lease	ReservationGroup + Reservation(s) + PartnerCompany + CompanyContract + BillingAutomation + PaymentPlan	Mews owns the underlying flows; Resident Platform composes them into a Lease lifecycle
Buyer	Company + CompanyContract(s)	Mews owns Company; Resident Platform layers NMA semantics
Lease extension	Reservations updateInterval + payment plan recompute	Mews state transition; Resident Platform owns lease-level audit
Network Participation Agreement (NPA)	—	Resident Platform owns entirely
Network Membership Agreement (NMA)	CompanyContract as substrate	Resident Platform layers NMA-specific terms

Jurisdictional layer

Long-stay lease structure is jurisdiction-dependent. The Resident Platform is jurisdiction-aware from day one. *(Even within the US, tenancy law varies state by state once stays exceed 28-30 days.)*

Jurisdiction	Operating model	Resident Platform default
US (state-by-state)	Residential tenancy law beyond 28 days; corporate-let exempts B2B from individual tenant protections	State-specific contract templates; explicit residential tenancy framing for stays 28+ days; B2B corporate-let template for buyer-paid leases
France	Bail mobilité (1-10 months); standard residential lease beyond	Bail mobilité template default for individual residents on professional assignment; flag for legal review beyond 10 months
Germany	Boardinghouse model up to 90 days; Mietvertrag (strong tenant protections) beyond	Boardinghouse contract default; flag for legal review beyond 90 days
UK	Renters' Rights Act 2025 abolished ASTs; corporate-let stays outside residential framework	Corporate-let template for B2B; flag for legal review if buyer is null (individual tenant)
Other	Varies by country	Generic Long-Stay Hospitality template with 'bespoke legal review required' flag

12-month roadmap

Q1 — Substrate foundations

- Resident, Lease, Buyer data model in Resident Platform service (Postgres + MongoDB for contracts)
- Mews Connector API client (façade pattern) — read-only, observability-first
- Jurisdictional contract template library for US-50, France, Germany, UK
- Webhook ingestion pipeline + state reconciliation
- Tier 1 surface scaffolding: long-stay booking engine MVP, resident portal skeleton
- First 5 lighthouse customers identified and onboarded for validation cycles

Q2 — Tier 1 ships + Network skeleton

- Tier 1 surfaces ship to all opted-in long-stay-running Mews customers (existing book benefits immediately)
- Boost/Revisn gap closures: room reassignment on extension, split bill rates, AR reconciliation post-issue
- Mews Payments deeper integration for recurring billing within Lease lifecycle
- Network Participation Agreement framework, first 50 properties opted in
- Mediated three-way contract view (Mews internal tooling)

Q3 — Lifecycle completeness + first anchor segment

- Corporate booker portal MVP with first buyer cohort: healthcare staffing agencies (anchor segment)
- Network Membership Agreement framework, first 10 B2B buyers signed
- End-to-end lifecycle: buyer creates lease → property confirms → contract generated → resident signs → activates → check-in → extension → check-out
- Commercial flows: take rate, Mews Payments routing, buyer billing aggregation
- Mews-internal ops tools for contract dispute resolution

Q4 — Anchor pilot + Phase 2 planning

- Healthcare staffing pilot: 50 corporate buyers, 100 Network properties, real Network GMV flowing
- Public launch announcement at Mews Unfold 2026 or equivalent
- EU Phase 2 scoping: Bail mobilité support, SEPA-led payments deepening
- Resident mobile app development begins
- Year-3 commercial plan locked

Commercial assumptions

Pricing model

Hybrid: Tier 1 add-on subscription + Tier 2 Network take rate.

- **Tier 1 (Resident Platform add-on):** ~\$8 per long-stay unit per month for properties that opt in. Attaches broadly across long-stay-running Mews customers regardless of Network participation.
- **Tier 2 (Network take rate):** 5-7% take rate on Network-brokered transactions. Applied only to Network-routed bookings; existing direct, OTA, and corporate relationships continue at zero Network fee.
- **Mews Payments uplift:** Existing ~2.5% Mews Payments take applied to recurring long-stay billing, which is significantly higher attach than short-stay because the platform makes it the path of least resistance.

Year-by-year trajectory (planning numbers, not forecasts)

Metric	Year 1	Year 2	Year 3
Properties opted in (Tier 1)	150-200	400-600	800-1200
Properties on Network (Tier 2)	30-50	100-200	200-400
Network GMV (annual)	~\$50M	~\$400M	~\$1B-3B
Tier 1 subscription ARR	~\$400K	~\$1.5M	~\$3M
Network brokerage take	~\$2-3M	~\$15-25M	~\$50-150M
Mews Payments uplift	~\$2M	~\$10M	~\$25-50M
Total incremental ARR	~\$5M	~\$30M	~\$80-200M

The load-bearing commercial hypothesis

Long-stay-heavy Mews customers will absorb a meaningful add-on price because the cost of their current custom workarounds exceeds the add-on cost. Boost Society maintains custom engineering on their Hife booking layer that almost certainly costs \$400K-\$1M per year in FTE — vastly more than \$20-40K of Resident Platform add-on. The validation work targets quantifying exactly this asymmetry.

Validation plan (first 90 days)

Four parallel streams. Each tests a load-bearing claim in the keystone.

1. Customer interviews (15-20 long-stay-heavy Mews customers)

Anchor list: Revisn, Boost Society (Hife), The Social Hub, Habyt, Zoku, Casa, The Fizz, Vesta Hospitality, Lyf-Ascott. Per interview: identify top 3 workflows they've built around the PMS today, hours/week on workarounds, dollar value of custom engineering they're maintaining. Boost Society's custom layer is the gold-standard validation target.

2. Internal Mews data analysis

Quantitative: % of Mews enterprises with >25% of reservations longer than 28 nights; customer-extension rate by long-stay-heavy vs short-stay cohorts; Open API call volume per reservation (heavier = building around the platform); NRR delta between long-stay-heavy and short-stay-heavy enterprises.

3. Field studies at Revisn and Boost Society

One day on-site at each. Watch the actual workflows — monthly invoicing, extension handling, deposit lifecycle, move-out. Identify where PMS is fine, where custom layer kicks in, where operator falls back to Excel or paper. Highest-signal-per-hour validation activity in the entire plan.

4. Prospect interviews

Mint House (Stayntouch, Nashville and other US metros — locally accessible). Anyplace, Wanderjaunt, Niido. What would have caused them to choose Mews? What did Stayntouch offer that they perceived Mews lacked? Three or four conversations tell us whether the problem is 'Mews loses on long-stay positioning' or something else.

Go-to-market

Two-sided onboarding, phased by customer cohort.

Phase A: Tier 1 to existing customers

Existing CSM organization. Roll out Resident Platform to long-stay-heavy Mews customers as an add-on. Capture subscription revenue. Validate the platform serves the existing book. No Network commitment required.

Phase B: Network opt-in for property supply

Selected Tier 1 customers opt into Tier 2 Network Participation. Mews's existing CSM team manages opt-in. Lighthouse customers (Revisn, Boost Society) onboard first to demonstrate the model.

Phase C: Buyer-side acquisition for anchor segment

Healthcare staffing agencies as anchor segment for US launch. Buyer acquisition via outbound to ~50 named healthcare staffing companies (Aya Healthcare, Cross Country Healthcare, Stanford Healthcare Travel Staffing, etc.). Anchor on US metros with strong Mews property concentration and high healthcare placement density: Nashville, Dallas, Phoenix, Raleigh-Durham, Boston, Houston.

Phase D: Public launch

Mews Unfold 2027 launches the Network publicly. By then: 50+ properties on Network, 10+ buyers signed, working pilot GMV flowing. Story is the credibility, not the announcement.

Why this over everything else Mews could build in 12 months

Compound value across three independent value streams

This is the rare 12-month bet that hits three Mews priorities simultaneously: (1) defends and deepens the existing book via Tier 1 universal platform value, (2) opens a structural new market via Tier 2 Network brokerage, (3) builds the foundation for Phase 2 international and consumer-facing expansion. No other 12-month bet hits all three. POS deepening is single-purpose. EU SEPA expansion is geographic, not new-category. Agentic AI features are platform-horizontal. The Resident Platform is the only investment that compounds across existing customers, new market, and future-state platform extensibility.

Glossary of terms

This glossary defines the key terms used throughout this document. The long-stay segment suffers from inconsistent terminology across the industry; these definitions reflect how terms are used specifically in the context of the Mews Corporate Long-Stay Network.

Term	Definition
Long stay	A stay of 28 or more consecutive nights at a single property. The lower bound of 28 nights is anchored on the most common US regulatory threshold (TOT exemption, tenancy law triggers). There is no hard upper bound — the ceiling is jurisdiction-specific and contract-structure-specific. For B2B corporate buyers, stays are effectively unbounded in duration.
Extended-stay hotel	A hotel purpose-built or configured for guests staying multiple weeks or months. Characterised by in-room kitchenettes, larger unit footprints, weekly housekeeping cadences, and laundry facilities. Examples: Extended Stay America, Residence Inn, Homewood Suites, Hyatt House, Marriott StudioRes, Hilton LivSmart. Operates under a hospitality licence on a hotel PMS. In scope for the Network.
Aparthotel / Serviced apartment	A hybrid property combining hotel-style services (front desk, housekeeping, F&B) with apartment-style units (separate living areas, kitchens, residential feel). Examples: Citadines, Adagio, Lyf (Ascott), Frasers, The Social Hub, Zoku, Hife (Boost Society). Operates under a hospitality licence on a hotel PMS. In scope for the Network.
Operator universe	The set of property types that use hotel property management systems (PMSs) and operate under hospitality licences. For the Mews Corporate Long-Stay Network, the operator universe is extended-stay hotels and aparthotels. Residential mid-term rental operators, PBSA, and pure coliving operators are outside the operator universe because they operate on different software stacks.
Mid-term rental (MTR) — operator	A residential property operator renting individually-owned furnished units for stays typically between 30 days and 12 months. Examples: Blueground, Furnished Finder hosts, Anyplace, Wanderjaunt. Operates on residential property management software (AppFolio, Buildium, Hostfully) — not hotel PMSs. Outside the Network's supply scope.
Mid-term rental (MTR) — duration	When used as a duration category (rather than an operator type), mid-term rental refers to stays in the 30-day to 6-12 month window. This document uses

	'long stay' as the preferred duration term to avoid confusion with the operator category above.
Corporate housing buyer	A B2B organisation that books accommodation on behalf of employees, contractors, or placed workers for stays of 28+ nights. The five broker-addressable demand drivers are: (1) business travel / executive relocation, (2) corporate mobility / international assignment, (3) project workforce (construction, energy, infrastructure), (4) healthcare staffing (travel nurses, locum physicians), and (5) insurance ALE (Additional Living Expense — displaced policyholders). Corporate housing buyers transact under Network Membership Agreements.
Broker-addressable demand	The portion of long-stay demand where a B2B brokerage adds value — specifically, demand driven by corporate housing buyers who require consolidated contracting, billing, and reporting across multiple properties. Estimated at 70% of US long-stay demand (\$54B of \$74B). The remaining 30% (\$20B) is non-addressable: students, digital nomads, leisure long-stays, and other individual demand flows served better by direct, OTA, or institutional channels.
Resident Platform	The Mews-internal service layer that introduces Resident, Lease, and Buyer as first-class product objects. It is a façade over the Mews Connector API — orchestrating existing Mews primitives (Reservations, Customers, Companies, CompanyContracts, BillingAutomations, PaymentPlans) into long-stay-native abstractions. Available as a Tier 1 universal add-on to all long-stay-running Mews customers, regardless of Network participation.
Mews Corporate Long-Stay Network	The Tier 2 opt-in brokerage marketplace built on top of the Resident Platform. Connects corporate housing buyers (via NMAs) with opted-in Mews properties (via NPAs) to enable programmatic B2B booking of 28+ night stays. Mews acts as the contractual mediator between buyers and properties and earns a brokerage take rate on Network-brokered transactions.
NPA — Network Participation Agreement	The contract between Mews and a property that opts into the Mews Corporate Long-Stay Network (supply side). Governs rate floors, maximum network exposure percentage, blackout dates, take rate terms, and the property's obligations when accepting Network-brokered bookings. Properties sign an NPA to become bookable inventory in the Network.
NMA — Network Membership Agreement	The contract between Mews and a corporate housing buyer that joins the Network (demand side). Governs payment terms, brokerage take rate, volume commitments, liability, and the buyer's right to search and book across all

	opted-in Network properties. Buyers sign an NMA to get programmatic access to Network inventory.
Three-way contract structure	The contractual architecture of every Network booking: NMA (Mews ↔ Buyer) + NPA (Mews ↔ Property) + individual lease/booking (Buyer ↔ Resident ↔ Property, mediated by Mews). Mews sits as contractual counterparty on both sides, which is what makes the take rate commercially legitimate and legally clean.
Façade architecture	The architectural pattern used by the Resident Platform. Rather than refactoring the Mews core PMS, the Resident Platform introduces a service layer that composes existing Mews Connector API primitives into long-stay-native abstractions (Leases, Residents, Buyers). The core PMS is not changed; it is orchestrated. This makes 12-month delivery credible and de-risks the model.
Tier 1 (universal)	Property-side platform benefits available to all long-stay-running Mews customers regardless of Network participation. Includes: Resident as first-class object, Lease as first-class commercial primitive, recurring billing infrastructure, jurisdictional contract library, resident web portal, and long-stay booking engine. Monetised via per-unit subscription add-on (~\$8/unit/month).
Tier 2 (opt-in)	Network brokerage benefits for properties that want incremental corporate housing demand. Includes everything in Tier 1 plus: Network Participation Agreement, inclusion in the Mews Corporate Long-Stay Network as bookable inventory, access to corporate housing buyers via the Network, and Mews-mediated contracting and payments. Monetised via brokerage take rate (5-7%) on Network-brokered transactions only.
Bail mobilité (France)	A French furnished tenancy contract designed for professionals and students on temporary assignment. Duration: 1-10 months. Offers more flexibility than a standard residential lease (no right of renewal, deposit capped at 2 months, terminable with 1 month notice). The Resident Platform defaults to the Bail mobilité template for individual residents on professional assignment in France.
Boardinghouse (Germany)	A German hospitality operating model for stays up to 90 days that sits outside residential tenancy law (Mietvertrag). Properties operating as Boardinghouses can host long-stay guests without triggering the strong tenant protections of German residential law. The 90-day threshold is the critical upper bound for hospitality-licensed operations in Germany.

Corporate let (UK)	A UK tenancy arrangement where the tenant is a company rather than an individual. Corporate lets sit outside the residential tenancy framework (now Assured Periodic Tenancies post-Renters' Rights Act 2025), giving operators and corporate housing buyers more flexibility on terms and duration. The Resident Platform defaults to a corporate let template for all B2B bookings in UK properties.
GMV (Gross Merchandise Value)	The total dollar value of long-stay bookings transacted through the Mews Corporate Long-Stay Network. The \$3B Year 3 Network 1.0 target is a GMV figure — not Mews revenue. Mews captures revenue from GMV via the brokerage take rate (5-7%), Mews Payments processing fees (~2.5%), and Resident Platform subscription fees. At \$3B GMV, estimated Mews revenue is \$200-280M ARR.
PBSA (Purpose-Built Student Accommodation)	Residential properties purpose-built to house students, typically on academic-year leases aligned to university terms. Operates on specialised student housing PMS software (StarRez, Adirondack Solutions). Outside the Network's operator universe and outside the broker-addressable demand definition. Student demand at hybrid properties like The Social Hub is captured in the non-addressable bucket regardless of operator type.
